

Quantitative Economics in Discrete and Continuous Time

Thomas J. Sargent and John Stachurski

May 16, 2020

Contents

Preface	x
Common Symbols	xii
1 Introduction	1
1.1 Overview	1
1.2 Motivating Examples: Dynamics	2
1.2.1 Capital Accumulation with Identical Agents	2
1.2.2 Wealth Dynamics	7
1.2.3 Inequality	17
1.2.4 Heavy Tails	22
1.2.5 Modeling a Pandemic	30
1.3 Motivating Examples: Optimization	30
1.3.1 Shortest Paths	30
1.3.2 Job Search	34
1.3.3 Optimal Saving	38
I Foundations	42
2 Mathematical Preliminaries	43
2.1 Notation	43

2.2	Real Analysis	44
2.2.1	Order and Topology in One Dimension	45
2.2.2	Ordinary Euclidean Space	46
2.2.3	Metric Space	51
2.2.4	Partial Order	60
2.3	Optimization and Fixed Points	65
2.3.1	Optimization	66
2.3.2	Convexity	68
2.3.3	Fixed Points	70
2.3.4	Borel Functions	75
2.4	Probability and Statistics	75
2.4.1	Distributions	75
2.4.2	Prediction	78
2.4.3	Some Useful Inequalities	80
2.4.4	Orders over Distributions	80
2.4.5	Heavy Tails	83
2.4.6	Estimating Distributions	87
2.5	Applications	89
2.5.1	Valuing a Consumption Stream	89
2.5.2	Granular Origins of Aggregate Fluctuations	90
2.5.3	Production Chains	90
2.5.4	Coase's Theory of the Firm	91
3	Introduction to Dynamics	92
3.1	Semidynamical Systems	92
3.1.1	Definition and Properties	92

3.1.2	Stability	94
3.1.3	Monotonicity in Discrete Time	96
3.1.4	Conjugate Dynamics	101
3.2	Some Continuous Time Results	103
3.2.1	Differential Equations	103
3.2.2	Monotonicity in Continuous Time	103
3.3	Applications	103
3.3.1	Valuing Consumption in Continuous Time	103
4	Markov Chains	104
4.1	Construction and Dynamics	104
4.1.1	Definitions and Examples	104
4.1.2	Distribution Dynamics	112
4.1.3	Conditional Expectations	117
4.1.4	An Operator-Theoretic View	119
4.1.5	Joint Distributions	121
4.2	Stability and Path Properties	123
4.2.1	Stationarity	123
4.2.2	Ergodicity	126
4.2.3	Global Stability	131
4.2.4	Infinite State Spaces	135
4.2.5	Power Laws from Markov Chains	138
4.3	Applications	138
4.3.1	Inventory Dynamics	138
4.3.2	Risk Neutral Asset Pricing	140
4.3.3	Asset Pricing with Risk Aversion	140
4.3.4	Epstein–Zin Preferences	141
4.3.5	Firm Dynamics with Entry and Exit	141

5	State Space Models	142
5.1	Linear Models	142
5.1.1	Deterministic Linear Dynamics	142
5.1.2	Adding Controls	145
5.1.3	Random Walks and Martingales	148
5.1.4	Vector Autoregressions	150
5.1.5	Distributions and Sample Paths	155
5.1.6	Linear State Space Models	161
5.2	Nonlinear Models	165
5.2.1	Distribution Dynamics	165
5.2.2	Random Coefficient Models	170
5.2.3	Stochastic Steady States	176
5.2.4	Analysis of a Stationary Distribution	179
5.3	Applications	182
5.3.1	Filtering and Prediction	182
5.3.2	Uncertainty Traps	184
5.3.3	The Evolution of Wealth	186
5.3.4	Numerical Methods	193
5.3.5	Speculation and Commodity Prices	201
6	Some Useful Optimization Problems	203
6.1	Optimal Search and Stopping Problems	203
6.1.1	Job Search Revisited	203
6.1.2	Rearranging the Bellman Equation	208
6.1.3	Learning the Offer Distribution	214
6.1.4	Entry an Exit	220

6.1.5	Optimal Harvesting	220
6.2	LQ Problems	222
6.2.1	Linear Control Systems	222
6.2.2	Finite Horizon Optimality	224
6.2.3	Infinite Horizon Problems	228
6.2.4	Investment with Adjustment Costs	231
6.2.5	Robust Control	234
6.3	Discrete State Decision Problems	234
6.3.1	An Inventory Problem	235
6.3.2	The General Finite State Case	238
7	Optimal Saving	246
7.1	Optimal Saving and Consumption	246
7.1.1	An Optimal Saving Model	246
7.1.2	Policies and Optimality	249
7.1.3	Problems with Analytical Solutions	254
7.1.4	CRRA Utility and Stochastic Financial Returns	257
7.2	A Model with Independent Shocks	263
7.2.1	Analysis	263
7.2.2	The Euler Equation	267
7.3	The Income Fluctuation Problem	274
7.3.1	Adding Non-Financial Income	274
7.3.2	Bounded Rewards	275
7.3.3	CRRA Preferences	275
7.3.4	State Dependence in Returns and Discounting	275
7.3.5	The Wealth Distribution Revisited	276

II	General Theory	277
8	Dynamic Programming: Theory	278
8.1	Planning Problems: Definitions and Concepts	278
8.1.1	Recursive Decision Problems	278
8.1.2	Policy Functions and Values	281
8.1.3	Definitions	283
8.1.4	Bellman's Principle of Optimality	285
8.2	Methods	287
8.2.1	Operators	287
8.2.2	A Fixed Point Result	288
8.2.3	Globally Stable Operators	289
8.2.4	Algorithms	293
8.2.5	Optimality of Stationary Markov Policies	293
8.3	Examples and Extensions	293
8.3.1	Markov Decision Processes	294
8.3.2	Optimal Stopping and Search	297
8.3.3	Monotonicity and Concavity	297
8.3.4	Unbounded Rewards	298
8.3.5	Recursive Utility	298
8.3.6	Shortest Paths	298
8.3.7	Plan Factorizations	298
9	Measure Theory and Functional Analysis	299
9.1	Normed Vector Spaces	299
9.1.1	Abstract Vector Spaces	299
9.1.2	Norms on Vector Space	302

9.1.3	Linear Operators	303
9.1.4	Finite Dimensional Vector Space	305
9.1.5	Ordered Vector Space	306
9.2	Inner Product Space	308
9.2.1	Inner Products	309
9.2.2	Orthogonal Projection	310
9.2.3	Overdetermined Systems	312
9.3	Tools from Integration Theory	315
9.3.1	Measure Theory	316
9.3.2	Integration	320
9.3.3	Information and Conditioning	325
9.3.4	L_p Spaces	325
9.4	Applications	327
9.4.1	Asset Pricing Revisited	327
9.4.2	Job Search with Correlated Wage Draws	327
10	Numerical Methods	333
10.1	Numerical Methods for Fixed Point Problems	333
10.1.1	The Curse of Dimensionality	333
10.1.2	Approximation and Projection	334
10.1.3	Contractions and Approximation	337
10.2	Numerical Methods for Savings Problems	342
10.2.1	Time Iteration	342
10.2.2	The Endogenous Grid Method	343

11 General State Markov Chains	344
11.1 Stochastic Processes in Discrete Time	344
11.1.1 Dynamics and Joint Distributions	344
11.1.2 Ionescu–Tulcea’s Theorem	346
11.1.3 Stationarity and Ergodicity	346
11.2 Markov Chains on Measurable Spaces	349
11.2.1 Markov Kernels	349
11.2.2 Distribution Dynamics	350
11.2.3 Stationary Distributions	350
11.3 Stability	351
11.3.1 Average Contractions	352
11.3.2 Harris Chains	354
11.3.3 Sample Path Properties	356
11.4 Monotonicity	356
11.4.1 Monotone Transitions	356
11.4.2 Monotone Mixing	357
11.4.3 Stability and Ergodicity	358
11.4.4 Parametric Monotonicity	358
12 Markov Jump Chains	359
12.1 Countable State Jump Chains	359
12.2 Control of Jump Chains	359
12.3 General State Jump Chains	359
13 Diffusions	360
13.1 Brownian Motion and Weiner Measure	360
13.2 Stochastic Integration	360
13.3 Diffusion Processes	360
13.4 Control Theory	360

III	Recursive Equilibria	361
14	Industry and Firm Dynamics	362
14.1	The Hopenhayn Entry-Exit Model	362
14.2	The Melitz Model	362
14.3	The Carvalho–Grassi Model	362
14.4	Markov Perfect Industry Dynamics	362
15	General Equilibrium Models	363
15.1	Bewley–Huggett–Aiyagari Models	363
15.2	An Example with CARA Utility	363
15.3	An Example with CRRA Utility	363
15.4	A Model with Default	363
IV	Appendices	364
16	Appendix I: Analysis and Probability	365
16.1	Topological Spaces	365
16.2	Metrics on Probability Space	368
16.3	Testing Compactness	368
17	Appendix II: Additional Proofs	371
17.1	Proofs from Chapter 4	371
17.1.1	Coupling	371
17.2	Proofs from Chapter 11	375
18	Appendix III: Solutions	380
